external file. This internal file exists only whilst the program is executing and behaves like a formatted sequential file. An internal file is a CHARACTER object such as a constant, variable, substring, array or array element, and is most often used for converting between CHARACTER and other data types.

Fortran 77 has two different types for floating point variables, called real and double precision. While reals are often adequate, some numerical calculations need very high precision and double precision should be used. Usually a real is a 4 byte variable and the double precision is 8 bytes, but this is machine

The I/O system is just being more lenient than described in the FORTRAN Standard. In general, when doing a formatted read of noncharacter variables, commas override field lengths. More precisely, for the I w , F w.d , E w.d [Ee], and G w.d input fields, the field ends when w characters have

Compiler capability is quite extensive and includes nearly all g77 features. We highly encourage users to move from g77, which is no longer maintained, and start taking advantage of GFortran's modern features. Legacy g77 code will compile fine in almost all cases. Status of Compiler and Run-time Library.
