Kani Method Frame

Kani's method of analyzing indeterminate structures, particularly, building frames was developed in Germany in the year 1947 by Dr. Gasper Kani. Like moment distribution it is a method of solving slope deflection equations by an iterative method.

Kani's method, also called the Rotation Contribution Method, is an approximate calculation method for indeterminate structures, particularly portal frames and multi-story frames with fixed connections. It is a much simpler and less time consuming method compared to the Moment Distribution Method.

Kani's Method - C R T

kani's method or rotation contribution method of frame analysis This method may be considered as a further simplification of moment distribution method wherein the problems involving sway were attempted in a tabular form thrice (for double story frames) and two shear co-efficients had to be determined which when inserted in end moments gave us the final end moments.

Frame structures are rarely symmetric and subjected to side sway, hence Kani's method is best and much simpler than pther methods like moment distribution method and slope displacement method. PROCEDURE: 1. Rotation stiffness at each end of all members of a structure is determined depending upon the end conditions. a. Both ends fixed. $K_{ij} = K_{ji} = EI/L$. b.

For sway frames, extra steps are required. A unit deformation must be applied to the degree-of-freedom associated with the sway, and the resulting force must be scaled to the force resulting from the full system restrained at that degree of freedom. Analysis of sway frames using the moment distribution method is not within the scope of this book.

Kani's Method it involves distributing the unknown fixed end moments of structural members to adjacent joints, in order to satisfy the conditions of continuity of slopes and displacements. The most important feature of Kani's method is that it is self-corrective. Any error at any stage of iteration is corrected in subsequent steps.
