Machining And Machine Tools By

Machining is a process in which material is removed from a workpiece to shape or finish it into a desired form. Drilling, holemaking, milling, turning, and threading tools are attached to compatible machinery such as a lathes, drill presses, or CNC machines to perform machining operations on the workpiece. The workpiece is typically a piece of raw material, sheets or rolls of stock, or an existing part, and the machine setup is typically guided by the type of material being worked on and the ...

A machine tool is a machine for handling or machining metal or other rigid materials, usually by cutting, boring, grinding, shearing, or other forms of deformation. Machine tools employ some sort of tool that does the cutting or shaping. All machine tools have some means of constraining the workpiece and provide a guided movement of the parts of the machine. Thus the relative movement between the workpiece and the cutting tool is controlled or constrained by the machine to at least some extent,
