Valve Material Selection Guide

The DeZURIK Material Selection Guide is designed to be used as a guide in selecting the most cost-effective valve materials. This guide should only be used as a starting point in your selection process. There are a variety of conditions which can affect the material chosen. Careful consideration must be given to temperature, the presence of other materials in the solution, and the concentration of the media. This guide is divided into two sections: one for elastomers and one for metals.

Choosing the proper valve material Engineers must consider flow media, pressure, flow velocity, and the intended purpose when selecting valves used in high-pressure water hydraulic circuits. By Mickey Heestand, Hunt Valve Inc. June 11, 2016 High-pressure water hydraulic systems have been widely used since they were developed in the late 1700s.

On the automotive side, PM is widely used as well as cast iron. Bronze valve guides are still widely used in European applications. Experts say substituting another valve or guide just because it is the same size is not the way to go. There are reasons that the materials were selected for use at the OE level.

The medium or substance flowing through a valve will often determine the type of valve body material. Some valve body materials are best suited for high temperature applications while others are best suited for their corrosion resistance to fluid substance still others are selected based on a low cost factor. Most times, manufacturers of valves will aid you in selecting the right valve for a given application after supplying the needed information.

Rev. 1/89/5M/B5-1. ANSI Classes & Body Material Selection. ANSI CLASSES It is important that the valve specifier understands ANSI Class ratings and pressure ratings; and they must clearly designate the appropriate standard class, special class, or intermediate class rating when specifying valves. When Valtek designates a valve pressure class according to ANSI B16.34, the following standard designations are generally used: Class 150, 300, 600, 900, 1500 or 2500.

Flow-medium properties, chemical composition, pressure, temperature, flow rate, velocity and viscosity are some of the important considerations in selecting suitable trim materials. Trim materials may or may not be the same material as the valve body or bonnet. API has standardized trim materials by assigning a unique number to each set of trim materials.
