Wind Tunnel Engineering

Wind tunnel, device for producing a controlled stream of air in order to study the effects of movement through air or resistance to moving air on models of aircraft and other machines and objects. Provided that the airstream is properly controlled, it is immaterial whether the stationary model under testing is

Read Book Wind Tunnel Engineering

designed to move through the air, as an aircraft, or to withstand wind pressures while standing in place, as a building.

Wind tunnel | aeronautical engineering | Britannica

A wind tunnel is a research tool developed to assist with studying the effects of air moving over or around

Read Book Wind Tunnel Engineering

solid objects. Air is blown or sucked through a duct equipped with a viewing port and instrumentation where models or geometrical shapes are mounted for study.

Wind tunnel | Engineering | Fandom

In wind engineering, wind tunnel tests are used to measure the velocity

Wind tunnel - Wikipedia

Wind tunnels help engineers and manufacturers design, create, and build faster, safer, more reliable, and more efficient products of all kinds—like wind turbines. In 2018, a team of engineers, technicians, and machinists at the National Renewable Energy Laboratory (NREL), designed and built the CWC's

In a controlled environment (wind tunnel) we can set the velocity, density, and area and measure the drag produced. Through division we arrive at a value for the drag coefficient. As pointed out on the drag equation slide, the choice of reference area (wing area) will affect the actual numerical value of the drag coefficient that is calculated.
